“Algebraic” Properties (I)

M

M

—

—

—

...

Why *algebraic* ?

“Algebraic” Properties (II)

For all $\sigma, \tau \in \Sigma^*$ and $\alpha \in \Sigma$:

For all $\sigma, \tau \in \Sigma^*$ and $\alpha \in \Sigma$:

$\sigma \alpha \tau = \sigma \tau \alpha$

$\sigma \alpha \tau = \sigma \tau \alpha$

“Algebraic” Properties (III)

For all P, Q, R , and Σ :

$$\left\{ \begin{array}{l} \Sigma \\ \Sigma \end{array} \right. \text{ and } \text{---}$$

Expansion Law ! (also called: *Interleaving*)

Compare to the notions of *standard forms* in Milner’s book: every process term can be transformed into a form that matches the left-hand side of the above equation.

Process Contexts

Definition: A process context is (precisely) defined by the following syntax:

$$M \quad M$$

The **elementary contexts** are

$$M, \quad M, \quad , \quad , \quad .$$

denotes the result of filling the hole of with process .

Process congruence

Definition:(Process congruence)

Let \sim be an *equivalence relation* over \mathcal{P} .

Then \sim is said to be a ***process congruence***, if
for *all* contexts C ,
 $C[P] \sim C[Q]$
implies $P \sim Q$.

Process congruence (II)

Proposition:

An arbitrary equivalence relation is a process congruence if, and only if, it is preserved by all *elementary contexts*; i.e., if

$$\begin{array}{ccc} & M & \\ & & M \\ M & & M \end{array}$$

Note:

For proving that an equivalence relation is a congruence, the elementary contexts suffice.

Congruence Properties

Proposition:

Bisimilarity is a process congruence, i.e., ...

Towards Observation Equivalence

Let us assume that our LTSs may dispose of a single distinguished *internal action* symbol, say: τ , as is the case for our language of concurrent process expressions. Then:

“Different internal behavior” should “not count” !

Definition:(observations / weak actions)

1.

2.

Weak Simulation

Definition:

is a weak simulation **iff**, whenever ,

if then there is
such that and .

if then there is
such that and .

weakly simulates ,
if there is a weak simulation such that .

Example:

Prove that weakly simulates .

Prove that weakly simulates .

Weak Bisimulation

Definition: (* straightforward / should be no surprise *)

A binary relation \sim is a **weak bisimulation**

if both \sim and its converse \sim^{-1} are weak simulations.

\sim and \sim^{-1} are **weakly bisimilar, weakly equivalent, or observation equivalent**, written $\sim \approx \sim^{-1}$,

if there exists a weak bisimulation \sim' with $\sim \subseteq \sim'$ and $\sim^{-1} \subseteq \sim'$.

Alternatively:

$\sim \cup \sim^{-1}$ is weak bisimulation

Proposition:

1. $\sim \cup \sim^{-1}$ is itself a weak bisimulation.
2. $\sim \cup \sim^{-1}$ is an equivalence relation.

Strong vs Weak

1. every strong simulation is also a weak one
2. implies

Examples ?

Proof ?

Example

Prove that

Some Inequivalences

Some Equivalences

Some Equations

Theorem:

Let P be any process.

Let M any summations. Then:

1.

2. $M \mid P \equiv M \mid P$

3. $M \mid P \equiv M \mid P$

Congruence Properties

Proposition:

Weak bisimilarity is a process congruence, i.e., ...

Example:

Observe !

Let .

Compare  !

Unique Solution of Equations

Theorem:

Let X_1, X_2, \dots be a (possibly infinite) sequence of process variables. In the equations

assume that $X_i = P_i(X_1, X_2, \dots)$. Then, up to α , there is a unique sequence of processes which satisfies the equations.
